

It's been a long time since the ducks quacked this loud

There is a timeless saying in the markets; *"feed the ducks while they are quacking"*.

There are periods when the market turns off and it is very hard to raise capital. At other times there can be a voracious appetite for stock which is partially satisfied by placements of new shares. The longer these periods last, the more companies go to the market for money, until brokers eventually suffer from deal fatigue. We have been in one of those times in recent weeks as the market continued to switch from a bearish sentiment to a bullish one. Companies are raising money, brokers are booking fees and investors are scrambling for stock as FOMO takes over. Whose complaining about that? Not I, but it can't go on forever.

The first signs of saturation appear on Thursday with the our stock market showing a decent daily correction, but then the Dow was slammed down 6.9% that evening. The narrative was all about the virus and the fear that the recovery would take longer, but the reality of market dynamics is that there had to be a moderation of the enthusiasm, so traders aggressively took profits.

We are not yet immune to such large daily downward movements, so there will be some fallout as fear raises its head, but recent experience also tells us that such a fall doesn't mean the game is over. Look at this as a circuit breaker while we try and figure out where the bigger trend lies. On Friday night the Dow bounced a little, but the real test will be how it performs next week.

Rumble - a good portfolio of exploration projects

We received a presentation by Rumble Resources (RTR) recently that left us thinking the this was a genuine, geologically strong exploration company worthy of our attention. Last week we added it to the chart coverage and now we are providing a summary of why we like it. I'm not the only one though, as the market capitalisation of around \$44m, with the share price doubling since late May, suggests that there is good support in the market.

Management is 80% of the criteria for investment

Starting with management first, as this should be the first test as to whether a company should be taken seriously, Rumble is blessed with a "mine finding geologist" in Brett Keillor, as a technical director. Brett was twice the recipient of the Prospector of the Year award, first for the Marymia discovery in 1998, then again in 2012 for the Tropicana discovery. He previously worked for Resolute Mining and was Chief Geologist (Gold) for Independence Group.

I can't say that I know much about the rest of the team but the Managing Director, Shane Sikora, is experienced in the corporate field, business development and strategic planning with six years in these roles in London. Hopefully he brings a level of commercial nous that is, unfortunately, frequently lacking in geologists.

High grade Western Queen is the main project

Located 110 km NW of Mt Magnet in WA, the project was acquired by Rumble in August 2019, with an option to acquire 100% from Ramelius Resources. Another \$1m in cash or shares is due in February, 2021.

The Western Queen Project covers a series of historical open pits. The WQ Central yielded 660,000 t at 8.9 gpt gold for 190,000 oz, when Equigold trucked ore to its Dalgaranga treatment plant, and the WQ South produced 25,500 oz at 3.6 gpt, mostly for Ramelius. The remaining resource is 962,000 t at 3.9 gpt, including a high grade component of 130,000 t at 9 gpt for 38,000 oz.

Brett Keillor has had a good look at the geology and come up with a reinterpretation that the previous mining was extracting the high grade gold in tremolite scary mineralisation. Cutting through all the geology, the thought now is that there are multiple shoots beneath old pits that seem to be up to 12m in width that are assaying 10-30 gpt. The good grade comes from the presence of coarse gold, but not nuggetty. These shoots generally offer 1,200 to 1,500 ounces per vertical metre (opvm), and sometimes higher. Placing this figure in perspective, an underground gold mine with only 500 opvm will struggle. It really needs to be more than 700 opvm to have a chance. Above 1,000 opvm is starting to look sexy.

Rumble is about to commence a 12,000m RC and DD drilling program to test six high grade shoots at depth. One could easily see that the potential is in the range of 0.5-1.0 Mz as a starting point. Untested 2 km of potential to the north lies between the Western Queen Central deposit and the Crane's prospect, where a series of reverse faults had complicated the picture in the past. This could host nearer surface mineralisation as well as depth extensions.

Lamil - the quest for another Telfer

The remote Paterson Range area is somewhat of a hot spot for greenfields exploration in WA. Here, Rumble has high hopes that it may have found Telfer Dome look-alike at the Lamil Project, located midway between the Nifty Copper Mine and Telfer. The quest is made more interesting with the knowledge that the normally deep cover may be less than 100m here. Gravity and passive seismic surveys have even reduced the expected cover to 30-60m in places. There have been 26 early stage targets identified, mostly geophysical, and five geochemical anomalies indicative of intrusive related copper-gold systems have been defined.

Geologists have been searching for more than 40 years for another "Telfer". So far it has been a bit like the quest for the Holy Grail. Exciting and elusive. At Lamil, AIC Mines Ltd is spending up to \$6m to earn a 50% interest, then perhaps another \$4m to go to 65%. The first drill holes may be put down in the September quarter. There is plenty of risk/reward here in what is an exciting project.

Thunder Projects in the Fraser Range with IGO

The Fraser Range is another remote, grass roots region with plenty of grass roots potential. Independence Group has earned 70% of both Thunderdome and Thunderstorm free carrying Rumble through to PFS. The Dome is more of a Ni-Cu-Zn polymetallic target located 30 km along strike from the recent Mawson's Ni-Cu discovery. The Storm is more of a gold target with some nickel and copper potential. About all you can say about these right now is that the ground is prospective and it is a low risk JV deal with a quality partner. Nothing to complain about here.

Other Projects in Gold and Base Metals

At **Munarra Gully** (100% RTR), located 60 km north of Cue, Rumble identified gold-copper and silver in a 50m wide alteration zone along a strike length of 1.5 km, open in all directions. It sees potential for both VMS and orogenic gold in what could be a large system. The next step will be to drill a few holes to expand upon the initial results.

Earaheedy (RTR 75%) is prospective for a large scale Zn-Pb-Ag system, in the range of 40-100 Mt, similar to historic major mining operations at Jinding in China (220 Mt at 7% Zn+Pb - resource) and Laisvall in Sweden (>100 Mt at ~4%Pb+Zn - endowment) i.e. moderate grades, open pit and large tonnages.

In Summary - Rumble is worth following

Rumble is a legitimate exploration company with a good mine-finding geologist, good projects in the hot spots of exploration with brownfields and greenfields status, and adequate funding. Expect good hits when it reports on the Western Queen drilling, but also expect that it will want to raise money as well. Hopefully the ducks will still be quacking.

Tesoro Resources seems to have an excellent gold exploration project in Chile

Tesoro Resources (TSO) is a recent entrant to the ASX, coming on via an RTO and going through a recompliance with Chapters 1 and 2 of the ASX Listing Rules in February 2020. It raised \$4.63m in the process. Initially it had two projects in Chile but it dropped Espina due to complications with access caused by the coronavirus. It is now focusing on the El Zorro gold project in northern Chile, in which it has a 70% interest (subject to shareholder approval in July), and a right to go to 80% on completion of a feasibility study.

El Zorro gold mineralisation has been classified as an Intrusive Related Gold (IRG) System, being different to the typical IOCG style found in the area. This means it is related to intrusive granite rocks that carried gold into the system. The very rich Pogo deposit in Canada is also an IRG-style, and it supports a very profitable gold mine now owned by Northern Star. You should be thinking millions of ounces now.

Tesoro has drilled 27 holes in to the Ternera prospect and come up with a number of good gold intercepts e.g. 86.4m at 2.29 gpt, 121.5m at 1.32 gpt, 84m at 1.3 gpt, 98m at 1.58 gpt and 58m at 1.7 gpt. This suggests a decent size at grades that can be quite profitable today. Tesoro is looking at a zone of interest measuring 1.5 km in length, 100m thick and extending down to depths of 300m.

Up to nine narrower high-grade zones have been identified within the system with four of them having been drilled, frequently returning grades of better than 4 gpt. These occur along NW-SE trending fault lines that cut across the strike. Each of these zones could host 150-200,000 oz, suggesting 1-2 Moz of gold in these structures with lower grades lying in the surrounding rocks. Bulking all of this together suggests a target grade of 1.2-1.6 gpt from pits that could extend to a depth of 250m, with underground potential in the higher-grade zones.

Tesoro plans to get two or three rigs turning from July, with a view to testing the ground to vertical depths of 200m. It is optimistic that it could be in a position to calculate a maiden resource by the end of 2020.

El Zorro's location is one of the big positives, being close to towns and a coastal port (55 km by road from Caldera) and at a low altitude. Sea water is accessible for process water, only 10 km away.

This is a simple, one project company to assess. The structure and geology seem to be well understood. There is clearly plenty of gold in the ground, as demonstrated by the drilling to date. Logistics are good. All that it needs now is more money to increase confidence levels ... which it is raising right now.

Accelerated Rights Issue and Placement

Tesoro went into a trading halt on Friday morning with an accelerated rights issue and placement which could raise up to \$6m at 6¢ a share. The placement accounts for \$3.2m of this. While the crunch of the Dow on Thursday night might have raised some eyebrows, the Company decided to continue with the plan to raise the money.

I have placed a bid for some placement shares for myself as I think this is potentially a very good company. If any readers would like some shares as well, email me on wgrigor@farestcapital.com.au with a bid before 9am on Monday morning. I would be happy to try and get you some stock. I have attached the Term Sheet for your information.

Disclosure: FEC may receive a fee on stock that it places. It currently does not own any share in Tesoro.

Lucapa completed \$5.2m raising

For those of you who may have missed it, Lucapa (LOM) successfully completed a 1 for 5 entitlement issue to shareholders, raising \$5.2m. This places the Company in a much stronger financial position to weather the impact of the coronavirus.

While the Mothae diamond mine remains on care and maintenance, probably until the end of 2020, the Lulo mine continues to work with a 50% reduction in manpower (hopefully the hardest working 50% is still on site). The boost to finances will ensure that the assessment of the kimberlite pipes continues over the coming months, with optimism high that after more than five years work the Company has narrowed the quest down to two pipes. It is still speculative at this point, but confirmation that they have found a source pipe could have a dramatic effect on the valuation of the Company.

Disclosure: Interest associated with the author own shares and options in Lucapa and it has been paid capital raising fees.

Canadians getting set in Saturn Metals

Last Monday we saw \$7m worth of Saturn Metals go through the market. It was subsequently disclosed that Peel Mining had sold 16 million shares (19%) of its 23.8% holding. The shares were spread around, but Dundee Corporation took five million, making them a 5.94% shareholder. Back in February the Bank of Nova Scotia (1832 Asset Management) announced an increase in its holding to 7.5% of Saturn. Both of these shareholders are well-regarded mining investment specialists in Canada. Between them they hold 13.44% of the issued capital of Saturn. It is quite possible that more Canadian money will follow them into the stock.

First Graphene completes \$6.2m raising

Just for the record, FGR has completed an entitlement issue that raised \$6.2m. The take-up was a pleasing >70%, with there being a strong shortfall book built to complete the raising.

Speaking with my chairman's hat on, it was a pleasing result. It is the first entitlement issue the Company has made, as opposed to placements, and it means that it is now well funded as it continues to build its sales book.

Disclosure: Interest associated with the author own shares in First Graphene. FEC has received capital raising fees. The author is the Non-Executive Chairman of FGR.

Disclosure: Interest associated with the author own shares in Saturn Metals

Sentiment Oscillator: Sentiment eased over the week, with 54% (56%) of the charts in uptrend and 22% (19%) in downtrend on Friday's close. The heavy selling in New York on Thursday night was only partially echoed in Australia. However, a number of charts came back to support lines the need to be held, or sentiment drops away.

Guides to Chart Interpretations

- Charts usually go pass from one trend (up or down) into the other via a period of indecision and uncertainty during which the trend can either recover or change. This period is signified by the orange colour. The orange represent both the greatest risk and greatest reward possibilities.
- Once a chart is in confirmed up or downtrends it is not uncommon for 10-20% of that trend to have already transpired.
- There are trends within trends. The focus of this chart review is the immediate trend that affects the sentiment i.e. it can be a downtrend within a long-term uptrend.
- Not every chart warrants a new comment every week. The new comments are in bold type. Grey type comments may be dated.
- Individual charts provide a single view. It is valuable to look at charts of other companies in similar commodities, and the overall sentiment is also very valuable. Not many stocks can swim against the tide.
- We periodically add or delete charts, some times for obscure reasons. If a chart consistent gives poor signals or is very erratic, we may delete it. Sometimes we add a chart because we want to see what all the fuss is about. We do have a preference for charting stocks that we cover in our research as well.
- Errors and omissions may occur from time to time, especially in fast moving markets.

Amber Lights in Tables: Just a reminder if when the amber light is used in the table – it is when the charts are ambiguous or when there is a change of trend taking place. If a chart is breaching a downtrend it can either be a positive sign or a trap. Only once it has done more work can it be confirmed as a new uptrend. Maybe it is a new uptrend (or conversely a new downtrend); the risk takers can decide to jump on board early (or sell). They will maximise their profits (or minimise their losses if indeed it is the start of the new uptrend (downtrend). More risk-averse investors should wait a little longer, being prepared to give up some of the gains in return for greater certainty.

Weightings of Sectors Represented in the Company Charts

Sector	No. of Companies	Weighting
Gold	30	21.7%
