21 May 2022

Chart comments as at Friday's close

Continuing with the downtrends irrespective of the election outcome

Election result to boost alternative energy stocks

Last week I said that this might be a good election to lose. In fact, the winner may have just been handed a poisoned challice. Managing inflation and the associated problems will not be easy, especially for an inexperienced government.

The power of the independents and the Greens may compromise any fundamental Labor Party initiatives with the risk that it could become just a puppet. If so, the outcome for Australia will be suboptimal, but Labor will be blamed for everything that goes wrong whether or not it is really its fault. That has been the nature of recent parliaments.

Labor was big on calling Scott Morrison a liar. Now it will have its turn at lying. Labor will be pulling its hair out while trying to satisfy so many interest groups, while the Liberals will have an opportunity to regroup and refresh.

As investors in the equity markets we will have to take what is served up to us by the government of the day, but international events and finance determine the trends more than the parochialism of Australian politics. The best we can hope for is a Federal government that doesn't make a mess of the job, or be dragged down into the gutter by media, conventional and social, that excessively amplifies the "what about me?" cries from vocal minority interest groups.

There will be winners on the bourse with Labor taking control. Foremost of these will be any company that is contributing to alternative energy, be it battery material stocks, hydrogen or new technology. Money is going to be thrown at these sectors as they will be the beneficiaries of Labor's promises to fight climate change.

Who should be blamed for climate change?

To be concerned about climate change is understandable. There are many disturbing signals from extreme weather events all around the world. Scientists have come up with explanations that the electorate is prepared to accept and now they want action. Hence the trend in the voting. However, there is a deep level of naivity in that understanding.

To blame our national government for climate change shows a fundamental failure to recognise who the real bad guys are. Look at Brazil with the destruction of Amazon forests. Look at the number of coal-fired power plants being build in China and India. Australia is insignificant in the big picture. We should only be holding our government accountable if they are in the position to make a real difference. Yes, it makes us feel good if the government is a team player in the climate battle, but let's not ignore those who should be most accountable. Let's not make our government the punching bag for the actions of others.

Downtrends still dominate, so be cautious

The charts show us that the market is continuing to move lower. We have seen enough days of heavy selling followed by subsequent rallies that in the majority of the share price charts there are well performing downtrends. Strong days are when you should be selling, and maybe you can buy back on the really bad days with a view to trading out in the next rally, but the market isn't deep enough to allow everyone to employ this strategy. Now is not the time to aggressively throw money into the market.

Of course, there will always be a minority of share prices that perform well, even in a bear market, but taking advantage of these requires careful stock selection. They can actually attract buyers like moths to a light.

We can take more time to clean out our portfolios, selling those stocks that were bought in a flurry but without any long term conviction. We need to have funds available to take advantage of future opportunities when they arise, rather than just holding on hoping that this is just a correction from which we can guickly recover.

QMines looking for another resource upgrade

FEC covered QMines (QML) in the Weekly of 20 November 2021, when the share price was 38¢. At the time we thought it was a promising emerging copper producer in Queensland with excellent logistical benefits, but it really needed to find additional resources to build the potential mine life. It is time to have another look with an additional six months exploration results to factor in.

QMines raised \$11.5m in an IPO, in May 2021, for the purpose of growing the resource at the Mt Chalmers mine that was originally developed by Peko-Wallsend, one of the great Australian mining companies in the 1960s through to the 1980s, when it was taken over by North Limited. Peko extracted about 1.24 Mt at 2% Cu and 3.6 gpt, mostly from the VMS-style massive sulphide mineralisation. QMines has gone back to assess and expand the disseminated mineralisation around the old mine, then 3.9 Mt at 1.15% Cu and 0.8 gpt Au. (1.9% CuEq).

Since listing, QML has come out with its second resource upgrade. The most recent, on 1/12/21, was a 38% boost to 5.8 Mt at 1.7% CuEq for 101,000 t copper equivalent. There was a high confidence level in this resource with 78% of it being in the Measured and Indicated categories. A 0.5% CuEq cut-off grade was applied. A third upgrade is expected late in September, that will incorporate drill results from the 2022 program.

The resource, around the old open pit, covers a 700m strike length from north to south and width of about 250m. There are zones up to 50m in thickness for the stringer zone and 5m to 20m for the massive sulphide domains. Mineralisation is exposed in the pits and extends to a

vertical depth of 200m below surface. The dip varies between 10° and 40° .

Metallurgy appears to be good with recoveries of 97% for copper, 86.5% for gold, 77.5% for zinc, 70.5% for silver and 85% for lead based on a 230 kg test size from diamond drill cores

The Company expects that the Woods Shaft exploration area, 700m SW of the Mt Chalmers Deposit, will add to the Dec 2022 resource. The zone of interest has a strike length of 350m and a width of 200m, to a depth of 90m vertical. Woods Shaft already has 40 historical holes and a new 21 hole program is about to commence. This should provide sufficient data to bring this prospect into a resource category.

With Mt Chalmers being a VMS-style orebody, it is reasonable to expect that more deposits will be found in close proximity. There are seven prospects being assessed, including three that are sufficiently advanced to be described as Exploration Targets within the Code.

The Bottom Line - sound value

The share price has come down along with the rest of the market, being 25 c at the time of writing. That gives a modest market capitalisation of \$28m. Cash as at 31/3/22 was reported as \$3.5m. There is no immediate need to raise funds, but a top-up is probably required in Q4, possibly after the release of the next resource upgrade.

Mt Chalmers is a tangible copper development opportunity with a relatively low risk profile and excellent logistics. There is little speculative content in the recent share price, meaning that there hasn't really been any exploration success factored in yet. The Company is sensibly investigating just how much larger the resource may be, testing nearby targets, in order to get a better idea of the optimum scale of any prospective mining operation. Upside in the share price could come from resources increases and exploration success that might change the scale of expectations. Copper is a good sector in which to maintain exposure, as a battery input material.

The Economist says concrete may be graphene's killer app. We agree

On 15th May, The Economic published an article entitled "The wonder material graphene may have found its killer app". So, the message that First Graphene has been articulating with respect to concrete is starting to get through to mainstream media. It was written from a high level viewpoint, and I don't agree with the accuracy of some of the numbers and opinions being quoted, but hey, any publicity is good publicity ... isn't it?

Regular readers will be aware my involvement in First Graphene, enabling me to have developed a deep understanding of the material and the graphene sector. There continues to be a number of misconceptions about what is possible when you add graphene e.g. that graphene in concrete can be used to avoid the need for rebar. That has not yet been proven, though use of graphene can reduce permeability of concrete by up to 50%, thereby ensuring rebar is less susceptible to ingress of water and consequential concrete cancer.

The article says that you can make graphene from many different materials, which is true, but the vast majority of these sources will never be commercial due to a range of issues that include cost and scalability. Make it work in a laboratory doesn't necessarily translate into an industrial scale process.

Determining when and where graphene works to give a commercial advantage in any given material involves more than extrapolating thought bubbles. As Adrian Potts says in the article, one of the biggest hurdles is achieving effective dispersion so that graphene can exercise its charm. Just throwing a handful of graphene into the pot falls a long way short of making it effective. Even the task of disbursing graphene into concrete is difficult, requiring proprietary know-how that most companies do not have.

Another point in the article is that there is a wide range of graphene qualities that need to be considered, taking into account how it is made, what defects are present and whether or not it is really graphene, in any event. This is a young sector where promotion has had the front seat, more so than actual delivery of commercial outcomes.

Two years ago we approached concrete companies with test results that showed concrete could be made +20% stronger with graphene. The response was rather dismissive, with operators saying that concrete could be made strong with the addition of a range of a materials, but they were happy with the products they supplied and there was no appetite for innovation.

Maybe you would think that if you could make concrete 20% stronger there would be a benefit in using 20% less in construction. The weight savings and engineering benefit could significantly add to the efficiency. But no, there is no interest in changing the standards or the designs. That would only complicate their lives and require architects to go back to their drawing boards. That would open up a compliance nightmare in dozens of jurisdictions and it would take years of test work before there is a green light.

It would seem the reality is much more simple. Keep the standards of strength at the levels they are now, but use graphene to reduce carbon emissions with a focus on chemistry rather than weight saving. That is what First Graphene is doing. We agree that there is huge potential for the graphene sector on this front and we believe we have the solution. We are now working on securing commercial scale orders, working closely with global supply partners in the cement supply chain.

Disclosure: Interests associated with the author own shares in First Graphene and the author is a director of FGR.

Lucapa comes up with another monster diamond

Last Wednesday Lucapa reported the recovery of a 204 carat diamond from the Mothae mine in Lesotho. The 204 carat white stone is the eighth +100 carat diamond and third +200 carat to be recovered from the Mothae mine since commercial mining commenced in January 2019, underlining its unique large stone nature. It was a simple release with no speculation as to what the stone may be worth, but you should expect it will be very valuable. Once again it confirms the high quality nature of the mine that is still not being factored into the share price.

Disclosure: Interests associated with the author own shares in Lucapa.

Democracy may be the best of a bad bunch

As I contemplated the political outcome a week prior to the election, I jotted down a few points on our Westminster system of democracy that we so vehemently defend and philosophised about who this system really serves? Who benefits the most? Maybe you could say that democracy protects our freedom, but with so many laws, regulations and rules, is this really freedom?

With the risk that it could be a be minority government at least half the electorate will not be happy with the outcome. Even if one party gets 50.1% of the vote, there will be almost half the population that will be unhappy with the outcome. That never bodes well for unity.

At least we get a regular opportunity to rotate the idiots out front every three years.

Democracy - a con or a noble concept?

Democracy is a noble concept but it is distraught with naivety. The suggestion that if each of us have a vote we will have some sort of path to freedom, is one of the greats cons in political philosophy.

Go back to the origins of modern democracy. You will see that it was birthed in the struggle between kings and the barons.

The barons and nobles needed the manpower of the masses to raise armies that could challenge the might of the kings

By using the universal suffrage platform the nobles could argue for the common cause,

just enough to gain the leverage over the Crown,

to rein it in

to curb its excesses,

so that the barons and the nobles could maintain control over their lives

without excessive interference from the Crown.

Democracy is really a mechanism whereby the wealthy can do as they wish within the laws of the land as passed by parliament,

and the common man is fooled into thinking he has control over his life,

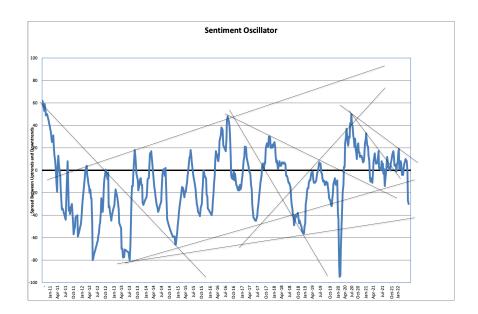

according to democratic principles.

Or maybe we just accept democracy for what it is with all its flaws

because we can't do anything else, and in any event,

it is the best system out of a bad bunch.

We have added Heavy Minerals (HVY), a prospective garnet company, and QMines (QML) a prospective copper company, to our char coverage.

Sentiment Oscillator: Sentiment softened further last week, notwithstanding some good rallies. There were 22% (21%) of the charts in uptrend and 52% (48%) in downtrend on Friday's close.

Guides to Chart Interpretations

- Charts usually go pass from one trend (up or down) into the other via a period of indecision and uncertainty during which the trend can either recover or change. This period is signified by the orange colour. The orange represent both the greatest risk and greatest reward possibilities.
- Once a chart is in confirmed up or downtrends it is not uncommon for 10-20% of that trend to have already transpired.
- There are trends within trends. The focus of this chart review is the immediate trend that affects the sentiment i.e. it can be a downtrend within a long-term uptrend.
- Not every chart warrants a new comment every week. The new comments are in bold type. Grey type comments may be dated.
- Individual charts provide a single view. It is valuable to look at charts of other companies in similar commodities, and the overall sentiment is also very valuable. Not many stocks can swim against the tide.
- We periodically add or delete charts, some times for obscure reasons. If a chart consistent gives poor signals or is very erratic, we may delete it. Sometimes we add a chart because we want to see what all the fuss is about. We do have a preference for charting stocks that we cover in our research as well.
- Errors and omissions may occur from time to time, especially in fast moving markets.

Amber Lights in Tables: Just a reminder if when the amber light is used in the table – it is when the charts are ambiguous or when there is a change of trend taking place. If a chart is breaching a downtrend it can either be a positive sign or a trap. Only once it has done more work can it be confirmed as a new uptrend. Maybe it is a new uptrend (or conversely a new downtrend); the risk takers can decide to jump on board early (or sell). They will maximise their profits (or minimise their losses if indeed it is the start of the new uptrend (downtrend). More risk-averse investors should wait a little longer, being prepared to give up some of the gains in return for greater certainty.

Weightings of Sectors Represented in the Company Charts						
Sector	No. of Companies	Weighting				
Gold	31	21.7%				
Gold Exploration	23	16.1%				
Nickel	11	7.7%				
Copper	11	7.7%				
Rare Earths	11	7.7%				
Oil/Gas	7	4.9%

FEC Disclosure of Interests: It is a requirement of ASIC that holders of AFS licences prominently disclose any conflicts of interest. At all times readers should be aware that Far East Capital Ltd is an active investor. It shares its research and opinions free of charge to other investors and it aims to do so on an ethical basis. Accordingly, when it is writing about stocks in which it holds interests, these will be disclosed. In this week's publication FEC discloses that interests associated with the the author hold shares in First Graphene. and Lucapa Diamond Company. The author is chairman of First Graphene and one of the largest shareholders, through a number of entities. Over the last three years FEC has received fees from Alicanto Minerals, Blackstone Minerals, Broken Hill Prospecting, Cobalt Blue, First Graphene, Golden Rim, Lindian Resources, Lucapa Diamond Company, Orinoco Gold, Pacific American and West Wits for corporate and capital raising services. Its primary business is investing and managing its own money, but it does occasionally raise money for resource companies.
