Pacific American Coal buys into graphene commercialisation business

Short week with the Easter slow down

It is common for investors to be looking for excuses to disengage from markets and avoid having to make decisions, especially when times are tougher. That is exactly what we have had this week in the lead up to Easter. Tidy the desk and forget the markets for a few days.

We had the good run from mid February until mid March. It was great to be making money again, but it was half over before anyone realised what was happening. The run was so strong that it was always going to lead to profit taking and with Easter approaching the markets slowed. It remains to be seen where we go when we come back next week, but I would be expecting another slow week if there aren't any intervening events.

Our charts have only been updated to the close of business as of Wednesday night, but since then the gold price was crunched in New York in an off-night for commodity prices. Interest rate uncertainty is having an influence.

Pacific American buying into graphene business ...

Last Monday this little coal company, with 250 Mt of coking coal (*JORC M/I/I*) in British Columbia, decided to embrace the advanced end of the carbon sector. It announced a deal whereby it will take an initial 20% interest in the private graphene commercialisation specialist, Imagine Intelligent Materials Pty Ltd (*Imagine IM*). That stake can be increased to 40% through a share exchange, making Pacific American Coal (PAK) the largest shareholder. The first 20% stake will be achieved by taking a \$1.25m placement in Imagine IM.

... graphene producers need to find buyers

We all know that graphene is the new wonder material. We know that companies such as First Graphite (FGR) and Talga (TLG) have access to orebodies that can employ electrochemical exfoliation processes to produce bulk graphene at a fraction of the cost of chemical vapour deposition (CVD) and other methods. However, we must remember that graphene is an industrial material and there is no open market as yet. That means a prospective producer of graphene has be out there finding buyers and they have to be able to shift volume to justify the development of mines designed to specialise in graphene. Its a chicken and egg dilemma. This is where *Imagine IM* steps in.

... Imagine IM is about commercialising technology

Imagine IM was set up two years ago with the specific objective of taking graphene technology from the laboratory to the commercial world. Its aim is to functionalise graphene and develop master batch materials that enable delivery of graphene's qualities (of superior conductivity, strength, flexibility to name just a few) into existing manufacturing processes. Imagine IM's revenue model is based on developing proprietary solutions that are licensed to end users, and then collecting royalties from the entire supply chain of companies that are involved in the manufacturing processes.

... quality assurance and standards regime

Imagine is agnostic as to where the input graphene material comes from provided it is fit for purpose and meets the precise specifications that are required to meet the solution. That leads to a critical component of the enterprise - characterisation and certification. One of the problems with buying graphene today is the lack of quality control and standards. I have had companies complain that what they order is often not what they receive. In some cases it is not even graphene but graphite. Everyone knows that this is a problem but no-one is doing anything about it - until now.

Imagine IM is responsible for delivering replicable functionality, at scale, to its customers. It has a strong interest in developing a comprehensive but highly focused standardisation regime delivered via measurement and use of trademarks. Members of the supply chain will be able to rely on its certification to gain confidence, and to know know that the product that contains graphene are fit for purpose. It is self re-enforcing.

... in-house graphene production capability

Notwithstanding Imagine's intention to source graphene from third party suppliers, it will still have the capability of producing its own graphene from a plant to be built in Geelong (*see attached pass clipping*). The initial capacity is 10 tonnes p.a. using graphite as the initial feedstock. This plant will initially be used to deliver functionalised graphene for known applications and existing Australian customers.

... first commercial product launch

Imagine IM proposes to launch its first commercial product in April, being a graphene coating aimed at the US\$16bn global geosynthetic industry. The conductivity of graphene will enable inexpensive leak detection capabilities to be realised at the point of installation. Conductivity leads to more downstream functions being possible.

The most obvious use of geotextiles to a person familiar with mining is the lining of tailings dams and land fills, but the market is much larger than this. Managing the impact of water in construction, roads and foundations is a continuing problem in infrastructure building. Graphene enhanced geotextiles have the potential to enable internet of things capabilities in every aspect of building and will enable real time monitoring of stress, heat, moisture and more.

The coking coal is still a sleeping asset in PAK

I have previously said that the 250 Mt of coking coal in will one day be valued by the market at 10c per tonne, in situ. At the moment the market is only giving it 1c per tonne. Some

time within one to five years we will see much better recognition. In the meantime it is a sleeping asset.

The Imagine IM transaction will be subject to shareholder approval and PAK will need to do a small placement to fund the initiative, but that shouldn't be difficult given the exciting new future which is unfolding. *Disclosure: Interests associated with the author own shares in PAK and Imagine IM and will benefit from the the proposed transaction and receive industry standard fees.*

Graphite Conference in Perth

During the week I attended the Australian Graphite Conference in Perth at which about a dozen graphite hopefuls presented their merits. The presenters were almost exclusively flake graphite companies, mostly competing for the same markets. We heard all of the usual hyperbole. Its amazing how many were fasttracking their projects and how many of these had entered the space as recently as 2015. Some even denied that there was going to be an oversupply.

There was only one vein graphite company at the conference; First Graphite Resources (FGR). Unlike all the other companies it is actually developing its mines now. These are small underground mines in Sri Lanka that will produce amazingly rich run-of-mine ore that

require almost no processing. That means minimal capital expenditure and basically no metallurgical risk. There is no impending problem with oversupply, but there is something even more compelling. It can convert that run-of-mine ore to high quality graphene at amazing yields and at a fraction of the cost of any other graphene producer.

Regular readers will know of my support for Talga over the past two years for similar reasons, but First Graphite actually looks like a much better, lower risk operator due to yields being about 10x those reported by Talga. That means much less capex for the same production capacity. It means almost no waste products. First Graphite started its testing 12 months after Talga but it has already caught up, spending much less money in the process.

It should not surprise you to learn that First Graphite has a Heads of Agreement with Imagine IM to participate in the downstream commercialisation of graphene produced from its vein graphite. It is thinking ahead, not content with just mining and selling ultra-high grade graphite. Its preparing to unlock the full value chain. The plot thickens. *Disclosure: Interests associated with the author own shares in FGR and the author is a director.*

Sentiment Indicator: In the three days of chart coverage we saw both the bulls and bears moderate in weight, suggesting lower conviction of sentiment either way. This isn't surprising when investors decide to sit on the fence. There were 39% (41%) of the stocks in uptrend and 25% (27%) in downtrend.

Guides to Chart Interpretations

- Charts usually go pass from one trend (up or down) into the other via a period of indecision and uncertainty during which the trend can either recover or change. This period is signified by the orange colour. The orange represent both the greatest risk and greatest reward possibilities.
- Once a chart is in confirmed up or downtrends it is not uncommon for 10-20% of that trend to have already transpired.
- There are trends within trends. The focus of this chart review is the immediate trend that affects the sentiment i.e. it can be a downtrend within a long-term uptrend.
- Not every chart warrants a new comment every week. The new comments are in bold type. Grey type comments may be dated.
- Individual charts provide a single view. It is valuable to look at charts of other companies in similar commodities, and the overall sentiment
 is also very valuable. Not many stocks can swim against the tide.
- We periodically add or delete charts, some times for obscure reasons. If a chart consistent gives poor signals or is very erratic, we may delete it. Sometimes we add a chart because we want to see what all the fuss is about. We do have a preference for charting stocks that we cover in our research as well.
- Errors and omissions may occur from time to time, especially in fast moving markets.

Amber Lights in Tables: Just a reminder if when the amber light is used in the table – it is when the charts are ambiguous or when there is a change of trend taking place. If a chart is breaching a downtrend it can either be a positive sign or a trap. Only once it has done more work can it be confirmed as a new uptrend.

Maybe it is a new uptrend (or conversely a new downtrend); the risk takers can decide to jump on board early (or sell). They will maximise their profits (or minimise their losses if indeed it is the start of the new uptrend (downtrend). More risk-averse investors should wait a little longer, being prepared to give up some of the gains in return for greater certainty.

Weightings of Sectors Represented in the Company Charts
